

JERIC SEMENIEGO

QA Interview Reviewer + 1-Week Job Plan

Pasig City, Metro Manila, Philippines | jeric.semeniego.work@gmail.com | +63 961 871 1368

Main identity: Reliable QA / IT Support candidate who can validate workflows, document issues clearly, support users, and help releases go smoothly.

1. Your Interview Core

Best 30-second introduction: I am Jeric Semeniego, a QA and IT Support professional with experience in SAP S/4HANA support, ServiceNow ticket handling, business process validation, regression testing, UAT support, technical troubleshooting, and documentation. My strongest areas are manual QA, issue replication, defect reporting, release validation, and user support. I also have supporting exposure to SQL, Selenium, Postman/API checks, SAP tools, GitHub, and web-based projects.

Best closing statement: Thank you for the opportunity. I am interested in this role because it fits my strengths in manual testing, defect documentation, UAT support, and release validation. I am willing to learn the team process and tools, and I am confident I can contribute through careful execution and clear communication.

2. Portfolio Walkthrough Script

30-second version: My portfolio shows a full manual QA process using purchase request, banking, and game QA case studies. It includes requirement analysis, test planning, test cases, defect reports, regression checks, UAT support, test execution reports, QA tools usage, and release validation.

60-second version: The portfolio is built to show how I think as a QA tester. The purchase request case focuses on workflow validation, roles, approval rules, status changes, and audit history. The banking case focuses on account balance accuracy, masking, authentication, session behavior, and cross-channel validation. The game case focuses on reward integrity, patch regression, crash/stability checks, and evidence-based bug reporting. The goal is to show practical testing thinking, not just definitions.

3. QA Fundamentals

Topic	Simple Answer	Interview Example
Functional Testing	Checks if the system works according to requirements.	Create request, submit, approve, reject, and status update work correctly.
Regression Testing	Checks existing features after a change or fix.	After approval fix, retest create, submit, approve, reject, status, and history.
Smoke Testing	Quick health check before deeper testing.	Login works, module opens, main workflow can start.
Sanity Testing	Focused check after a small fix.	Verify approved request is now read-only after the fix.
UAT	Business users confirm if the system meets their needs.	Requester and approver confirm the workflow is correct.
Retesting	Checks if a specific bug is fixed.	Repeat the exact bug steps to confirm it no longer happens.

4. STLC / QA Workflow

1. Requirement Analysis - review requirements, clarify scope, identify risks.
2. Test Planning - define scope, environment, entry criteria, and exit criteria.
3. Test Design - create scenarios, test cases, expected results, and RTM.
4. Test Data - prepare valid, invalid, boundary, and role-based data.
5. Environment Check - confirm QA/staging is ready through smoke checks.
6. Execution - run test cases and record pass, fail, or blocked.
7. Defect Management - log bugs with steps, expected vs actual, severity, and evidence.
8. Retesting and Regression - verify fixes and confirm related features still work.
9. Reporting - summarize results, risks, blockers, and release recommendation.

5. Bug Report Formula

Use this structure: Title, Environment, Preconditions, Steps to Reproduce, Expected Result, Actual Result, Severity, Priority, Evidence, Impact, and Retest Notes.

A good bug report should make the issue easy to reproduce and easy to prioritize.

Severity	Meaning	Example
Critical	Blocks core flow or major business impact.	User cannot log in or duplicate banking transaction occurs.
High	Major feature issue with workaround or business risk.	Approved request remains editable.
Medium	Feature works partially or incorrect message/display.	Rejection allowed without reason.
Low	Minor UI or text issue.	Alignment or spelling issue with no functional impact.

6. API / Postman Basics

API testing means sending a request and checking the response. In Postman, validate the method, URL, headers, auth token, request body, status code, response body, error message, and business rules.

Status Code	Meaning
200	Successful request
201	Created
400	Invalid request/data
401	Unauthorized
403	Forbidden/no permission
404	Not found
500	Server error

Best interview line: I have basic API testing awareness using Postman. I can validate response status, response body, required fields, error messages, authentication behavior, and business rules.

7. SQL Basics for QA

QA uses SQL to validate backend data after an action. Example checks: correct status saved, correct history record created, correct user/account returned, and no duplicate record created.

Know these: SELECT, WHERE, ORDER BY, COUNT, GROUP BY, JOIN basics, and checking records by ID/status/date.

8. Banking QA Reviewer

Main focus: transaction accuracy, authentication, account masking, session timeout, audit trail, error handling, balance accuracy, access control, and regression after changes.

Scenario	Expected Check
Login with MFA	User authenticates successfully and session is created.
Wrong password	Login fails without revealing sensitive account details.
Balance display	Available and ledger balance match business rules and test data.
Account masking	Only allowed last digits are visible.
Logout/browser back	Protected pages cannot be accessed after logout.
API response	Status code, fields, account ownership, and masking are correct.

9. Game QA Reviewer

Main focus: gameplay behavior, UI/visual issues, crash or freeze issues, reward integrity, reconnect/session change behavior, device/platform compatibility, and patch regression.

Scenario	Expected Check
Reward claim	Reward is granted once only and logs match.
Reconnect during claim	Reward does not duplicate after reconnect.
Patch regression	Recent fixes still work after new build.
Crash/freeze	Capture platform, build, steps, video, logs, and reproduction rate.

10. ServiceNow / SAP Interview Notes

ServiceNow: ticket handling, incident tracking, status updates, escalation, documentation, and defect/workflow validation.

SAP S/4HANA: enterprise business process platform. Your experience is support and validation: investigating workflow, data, access, patch/reset, and incident-related issues.

Best line: I supported SAP S/4HANA business process validation through ServiceNow ticket handling, regression testing, UAT support, documentation, and escalation coordination.

11. Automation Awareness

Say this honestly: My strongest area is manual QA. I have exposure to Selenium and API testing concepts and I am improving my automation skills. I understand automation is best for stable, repeatable, high-risk regression or smoke checks.

Tool	How to position it
Selenium	Basic awareness for browser automation and repeatable UI checks.
Postman	Basic API response and business rule validation.
SQL	Backend data/status/history validation.
Browser DevTools	Console error checking, network observation, and UI inspection.

12. Scale AI / Outlier Screening

Treat it as QA for AI outputs. Check if the AI followed requirements, format/schema, constraints, and expected behavior.

Formula: Requirement -> AI output -> issue -> evidence -> impact -> corrected output.

Term	Meaning
PRD	Product Requirements Document
Rubric	Scoring criteria
Golden Path	Best correct solution/output
Schema	Required output format
Trajectory	AI step-by-step work
Frontend	UI/layout/forms
Backend	API/database/auth logic

13. Common Interview Questions

Tell me about yourself.

I am a QA and IT Support professional with SAP S/4HANA support, ServiceNow ticket handling, regression testing, UAT support, issue validation, and documentation experience.

What is regression testing?

It confirms existing features still work after a fix or change. I retest the fixed issue first, then run related impacted test cases.

How do you report a bug?

I include title, environment, steps, expected result, actual result, severity, priority, evidence, and impact.

What if you do not know the answer?

I do not overclaim. I clarify the requirement, check documentation, test carefully, document findings, and escalate when deeper technical validation is needed.

Why should we hire you?

I am reliable in manual QA execution, issue documentation, regression validation, UAT support, and communicating clearly with teams and users.

14. 1-Week Job Plan

Day	Focus	Output
Day 1	Finalize resume, portfolio, and LinkedIn/JobStreet profile.	Resume uploaded, portfolio link tested, profile headline updated.
Day 2	Apply to Manual QA, QA Analyst, UAT Tester, Application Support.	15-20 applications sent.
Day 3	Study QA fundamentals and rehearse interview answers.	Practice tell-me-about-yourself, regression, bug report, API, SQL.
Day 4	Apply to IT Support, Service Desk, SAP/ServiceNow Support.	15 applications sent plus recruiter messages.
Day 5	Portfolio walkthrough practice.	Can explain purchase, banking, game, and

		tools cases in 60 seconds.
Day 6	Mock interview and weak-topic review.	Record answers; fix weak areas.
Day 7	Follow-ups and second wave applications.	Follow up with recruiters; send another 15-20 targeted applications.

15. Daily Routine Until Hired

- Apply to 10 QA/UAT/Application Support roles.
- Apply to 5 IT Support/Service Desk roles.
- Send 2 recruiter messages.
- Study 30 minutes: QA/API/SQL/ServiceNow.
- Practice 5 interview questions out loud.
- Track every application in a spreadsheet.

16. Final Cheat Sheet

My strongest value is manual QA and support work: requirement review, test execution, workflow validation, defect documentation, UAT support, regression testing, and release readiness.

Never overclaim. Say: My strongest area is manual QA, and I have supporting exposure to automation, API, SQL, and technical validation tools.
